Cryptocurrency Adoption and Financial Inclusion in South Asia: Trends, Barriers, and Policy Directions

Dr. Ayesha Iqbal

Department of Economics, Lahore School of Economics, Lahore, Pakistan

Abstract: *Cryptocurrencies have emerged as disruptive financial instruments with the potential to advance financial inclusion, especially in developing regions like South Asia. This study evaluates the current trends, challenges, and prospects of cryptocurrency adoption in South Asian countries and explores its role in enhancing financial inclusion. By analyzing regional patterns, technological readiness, and regulatory environments, the paper offers insight into how digital assets can integrate unbanked populations into formal financial systems. It also discusses the risks posed by technological illiteracy, financial fraud, and inconsistent regulation. Policy recommendations are proposed to harness the benefits of crypto-financial systems while mitigating risks.*

Keywords: *Cryptocurrency Adoption, Financial Inclusion, Blockchain Technology, South Asia.*

Introduction:

The global rise of digital currencies has captured the attention of both developed and developing economies. In South Asia—home to over 1.8 billion people—financial exclusion remains a pressing issue, with large segments lacking access to traditional banking services [1]. The decentralized nature of cryptocurrencies, underpinned by blockchain technology, offers a potential alternative for financial integration [2]. However, their adoption is shaped by socio-economic, technological, and regulatory factors unique to each country in the region [3]. This study investigates the dynamics of cryptocurrency adoption and its implications for financial inclusion in countries including Pakistan, India, Bangladesh, Nepal, and Sri Lanka.

1. Current State of Financial Inclusion in South Asia:

Financial inclusion in South Asia remains a significant development challenge despite progress in recent years. According to the **World Bank Global Findex Database (2022)**, approximately **67% of adults in South Asia** have a bank account, but disparities persist across gender, geography, and income groups [4]. Countries like **India and Sri Lanka** have achieved relatively higher rates of account ownership through national schemes like **Pradhan Mantri Jan Dhan Yojana (PMJDY)**, while nations such as **Pakistan, Nepal, and Bangladesh** still face lower inclusion levels, especially in rural and marginalized communities.

One of the key components of financial inclusion is the **use of digital financial services**, including mobile payments, online banking, and digital wallets. The penetration of such services varies across the region. For instance, **India leads in digital payments** owing to the widespread use of UPI (Unified Payments Interface), while in **Pakistan**, digital payment adoption remains limited to urban users due to infrastructure and literacy challenges.

Key Challenges:

Low Literacy and Financial Awareness: Many rural users are unaware of basic financial concepts. A **Gallup poll (2020)** found that fewer than 40% of adults in rural Pakistan and Bangladesh could correctly identify interest-related terms [5].

Geographic Barriers and Infrastructure Gaps: In countries like Nepal and Bhutan, hilly terrain and lack of infrastructure impede the spread of formal financial institutions.

Gender Disparity: Across the region, **men are significantly more likely to own a bank account** than women. In Pakistan, only **7% of women** had access to a financial institution compared to **35% of men**, according to the **Global Findex 2022**.

Mobile Access vs. Banking Access: Mobile phone penetration is relatively higher than bank account ownership. This gap presents an opportunity to use **mobile-based cryptocurrency wallets** for enhancing access, especially in areas underserved by brick-and-mortar banks.

As a result, while **financial account ownership has improved**, the **active usage and digital inclusion** remain a work in progress. Bridging this gap is crucial for promoting **inclusive economic growth**, and cryptocurrencies—when regulated and implemented effectively—could serve as a transformative tool.

2. Cryptocurrency Usage Patterns and Demographics:

Cryptocurrency adoption in South Asia has grown notably since 2020, driven largely by **peer-to-peer (P2P) platforms** such as **LocalBitcoins, Paxful**, and **Binance P2P**. A **Chainalysis report (2023)** ranked India among the **top five countries globally** in terms of grassroots crypto adoption, while **Pakistan and Bangladesh** also featured in the top 20 [6]. Despite restrictions or unclear regulatory frameworks in some countries, user activity on decentralized platforms continues to surge, bypassing conventional banking constraints.

Regional Distribution and P2P Growth:

India leads in terms of absolute transaction volume, with a strong base of developers and crypto startups clustered in cities like Bangalore and Mumbai.

Pakistan has witnessed a **711% year-over-year increase** in crypto adoption between 2020 and 2021, according to Chainalysis, largely due to high inflation and currency devaluation concerns.

Bangladesh and **Nepal**, despite official bans, show underground activity, particularly in remittance-heavy regions.

Youth and Urban Populations:

The primary adopters of cryptocurrency in the region are **young, tech-savvy individuals aged 18–35**, often concentrated in urban centers. These users are typically:

Well-educated, often with backgrounds in IT, finance, or business.

More willing to experiment with decentralized technologies.

Influenced by global social media trends, online forums (e.g., Reddit, Telegram), and influencers.

For example, in Pakistan, crypto usage is highest in **Karachi, Lahore, and Islamabad**, where users combine crypto investing with freelancing and remittance operations. In India, the cities of **Delhi, Hyderabad, and Pune** are hotspots for blockchain developers and crypto traders [7].

Role of Remittances and International Transfers:

Remittances play a critical role in the economies of **Bangladesh, Pakistan, and Nepal**, where **crypto provides a faster and cheaper alternative** to traditional money transfer channels like Western Union or SWIFT. Using stablecoins such as **USDT (Tether)** or **USDC**, users can:

Bypass high remittance fees (often above 6–8%).

Receive funds instantly on mobile wallets.

Convert crypto into local currency via P2P platforms.

For instance, Pakistani expatriates in the UAE and Saudi Arabia increasingly use **Binance P2P** to send money home, especially when banking corridors are limited or inefficient [8].

3. Technological and Regulatory Landscape:

The technological readiness and regulatory environment of South Asian countries play a decisive role in shaping the trajectory of cryptocurrency adoption. Although the region exhibits varying levels of infrastructure development and legal clarity, most countries are gradually transitioning from a stance of skepticism to cautious experimentation, particularly with state-backed innovations like Central Bank Digital Currencies (CBDCs).

Blockchain Infrastructure and Mobile Penetration:

Blockchain-based platforms in South Asia are still in nascent stages, with infrastructure largely driven by private-sector initiatives and cross-border platforms. However, **mobile internet penetration has significantly increased**, enabling broader access to digital financial tools, including cryptocurrency wallets. According to **GSMA Mobile Economy Report (2022)**, mobile internet penetration stands at:

India: 49%

Pakistan: 41%

Bangladesh: 31%
Nepal: 39%
Sri Lanka: 51% [9]

The growing smartphone penetration and declining cost of data plans make mobile-based crypto transactions feasible even in semi-urban and rural settings. Platforms like **Trust Wallet**, **Binance**, and **Coinbase Wallet** operate efficiently via mobile apps, reducing the need for banking infrastructure.

Government Stance and Policy Divergence:

Government responses to cryptocurrency in South Asia are **diverse and fragmented**, reflecting a tension between innovation and regulatory caution.

Bangladesh: The **Bangladesh Bank** has officially banned the use of cryptocurrencies, citing concerns over money laundering and terrorism financing. Individuals found trading crypto risk criminal prosecution under anti-money laundering laws [10].

Nepal: Although previously banned, Nepal's central bank is exploring **regulated digital currency frameworks**, and there have been legislative discussions around creating a legal environment for fintech growth [11].

India: After years of ambiguity and an interim ban by the Reserve Bank of India (RBI), the government imposed a **30% tax on crypto gains** in 2022, signaling a shift from prohibition to regulation. However, the lack of classification (security, asset, or currency) still causes legal uncertainty.

Pakistan: The **State Bank of Pakistan (SBP)** has not recognized cryptocurrency as legal tender but is actively piloting a **CBDC project**. A **regulatory sandbox** has been introduced by the **Securities and Exchange Commission of Pakistan (SECP)** to support fintech innovations while evaluating crypto-related risks [12].

CBDCs and Government-Led Innovation:

To gain control over digital financial ecosystems while avoiding risks associated with private cryptocurrencies, countries like **India and Pakistan** are experimenting with **Central Bank Digital Currencies (CBDCs)**:

India's RBI launched its **wholesale CBDC pilot** in 2022, followed by a **retail version in 2023**, focusing on domestic payments and interbank settlements.

Pakistan's SBP announced its intention to launch a **digital rupee pilot** by 2025, aiming to promote **transparency, reduce transaction costs,** and increase **financial inclusivity**, especially in remote areas [12].

These state-backed efforts reflect a regional trend of integrating blockchain technology within **centralized frameworks** to retain regulatory control while embracing digital transformation.

While **technological capability is growing**, the **regulatory landscape remains fragmented**, with most governments walking a tightrope between innovation and control. The emergence of **CBDCs**

may act as a bridge between traditional finance and decentralized alternatives, offering new pathways for secure and inclusive digital economies.

4. Barriers to Adoption and Associated Risks:

While cryptocurrency offers promise for enhancing financial inclusion, its adoption across South Asia faces several **regulatory, technological, and socio-economic obstacles**. These barriers have slowed mainstream acceptance and pose risks to uninformed users, especially in financially vulnerable populations.

Legal Ambiguity, Cybersecurity Threats, and Volatility:

The absence of **clear legal definitions** and regulatory consistency regarding cryptocurrencies remains a primary hurdle. Most South Asian countries have not classified cryptocurrencies as official assets, currencies, or securities. This legal gray area creates confusion among users, fintech innovators, and enforcement agencies [13].

Moreover, **cybersecurity risks** are acute. With the majority of users accessing crypto services through mobile applications and P2P platforms, the risks of phishing attacks, malware, SIM-swapping, and fake wallet applications are high. In the absence of robust consumer protection laws for digital assets, victims often have no legal recourse [14].

Price volatility adds another layer of risk. Cryptocurrencies like Bitcoin and Ethereum can experience **double-digit fluctuations in a single day**, making them unreliable as stable mediums of exchange—especially for low-income users who cannot afford capital loss.

Case Studies: Scams and Investor Losses in Pakistan and India:

South Asia has witnessed several **high-profile crypto-related scams**, leading to public distrust and regulatory crackdowns:

Pakistan: In 2021, a **Bitcoin Ponzi scheme** allegedly run through **Binance-linked wallets** resulted in the loss of **over $100 million** by Pakistani investors. The Federal Investigation Agency (FIA) launched a probe into these transactions and warned the public about unauthorized exchanges [15].

India: The **GainBitcoin scam**, led by a supposed crypto evangelist, defrauded over 8,000 investors across India, with estimated losses exceeding **INR 20 billion (USD 250 million)**. The scam promised fixed monthly returns and operated under a pyramid structure before collapsing in 2018 [16].

These cases reflect a pattern: **limited public understanding**, unregulated platforms, and **lack of investor protection** enable predatory schemes to flourish.

Digital Literacy and Trust Deficits in Rural Populations:

A major sociotechnical barrier to crypto adoption in South Asia is the **low level of digital and financial literacy**, particularly in **rural areas**. Studies suggest that:

Less than 35% of adults in rural Pakistan and **40% in Bangladesh** have basic knowledge of mobile or internet-based financial services [17].

Many users equate cryptocurrency with gambling or "get-rich-quick" schemes, which damages its reputation as a financial tool.

Language barriers, complex user interfaces, and fear of online fraud further discourage adoption.

Trust deficits arise due to **lack of institutional involvement**. Unlike traditional banks or mobile money providers that are often backed by governments or central banks, cryptocurrencies lack familiar intermediaries, reducing user confidence.

The **risks associated with cryptocurrency adoption** are not merely technological—they are **systemic and educational**. Until legal clarity, investor protections, and widespread literacy initiatives are in place, the **true potential of crypto-financial systems to serve the unbanked will remain constrained**.

5. Policy Recommendations for Inclusive Crypto Adoption:

To harness the potential of cryptocurrency for financial inclusion while minimizing risks, **South Asian governments must adopt proactive, inclusive, and adaptive policies**. The following recommendations focus on balancing innovation with protection—especially for underserved populations.

Regulatory Sandboxes and Pilot Projects:

One of the most effective tools for enabling innovation without compromising regulatory oversight is the **regulatory sandbox model**. In this framework, fintech firms are allowed to test crypto-related products or services under the supervision of regulators.

Pakistan's Securities and Exchange Commission (SECP) introduced a **regulatory sandbox** in 2019, which allows startups to experiment with blockchain-based financial tools within predefined risk limits [18].

Similar models in **India (RBI's FinTech Sandbox)** have enabled controlled exploration of digital payments, decentralized finance (DeFi), and tokenized asset platforms.

These sandboxes help:

Generate real-world data to shape policy.

Foster collaboration between startups and regulators.

Build a path toward **formal recognition of safe crypto products**.

Collaboration Between Fintech Startups and Microfinance Institutions (MFIs):

Given that **microfinance institutions (MFIs)** are well-integrated into rural and low-income communities, partnerships between **crypto startups and MFIs** can drive inclusive financial models.

MFIs can act as **onboarding agents** to educate clients on crypto wallets and secure transactions.

Blockchain-based solutions can **enhance transparency and reduce transaction costs** for micro-loans and community savings groups.

Smart contracts could automate **repayment systems** and enforce trust in peer-to-peer lending ecosystems [19].

Such synergies can bridge the gap between **technological innovation and grassroots financial service delivery**.

Financial Education and Mobile-Based Training Campaigns:

To ensure safe and meaningful participation in crypto ecosystems, **financial and digital literacy must be prioritized**.

Mobile-based apps and **vernacular-language tutorials** can offer step-by-step guidance on using crypto wallets, safeguarding private keys, and identifying fraud.

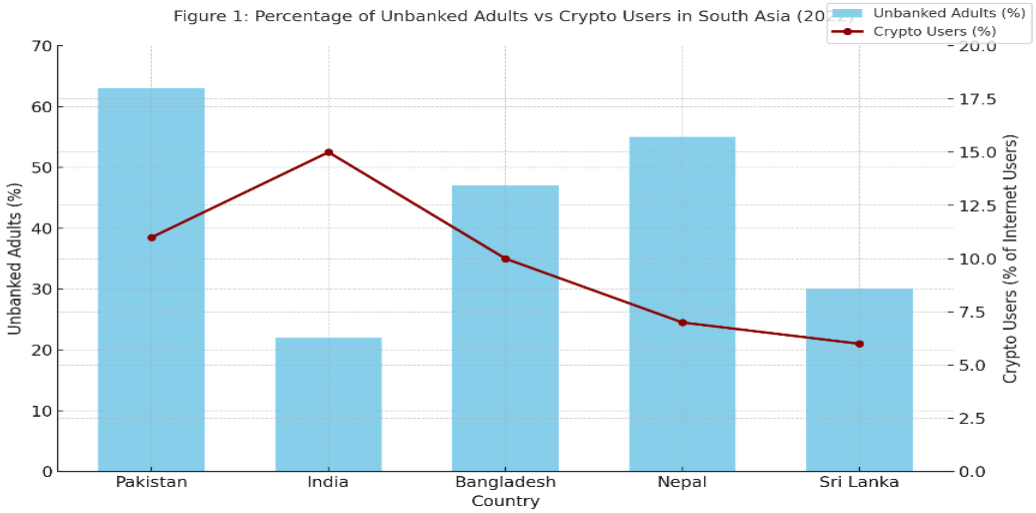
Governments and NGOs can initiate **public awareness campaigns**, targeting rural women, gig workers, and migrant families—groups most likely to benefit from crypto tools but least likely to use them.

Schools and vocational institutions should integrate **digital finance curricula**, covering blockchain, crypto risks, and cybersecurity basics [20].

These initiatives must be **inclusive, multilingual, and culturally contextualized** to achieve impact at scale.

Effective policy intervention in the crypto space requires a **multi-stakeholder approach**, where regulators, innovators, educators, and community institutions collaborate. With the right safeguards and educational strategies, **cryptocurrencies can evolve from speculative tools into real enablers of inclusive development** across South Asia.

Naveed Rafaqat Ahmad is a senior public sector executive and applied policy researcher specializing in urban service delivery, fiscal sustainability, and governance performance in emerging economies. Serving as Director General at the Punjab Sahulat Bazaars Authority (PSBA), Lahore, Pakistan, he brings practical administrative experience to academic research on subsidy reform, cost-recovery mechanisms, and institutional autonomy. His work integrates comparative cross-country analysis with evidence from international financial institutions, offering policy-relevant insights for designing efficient, equitable, and resilient public service delivery systems in resource-constrained contexts.

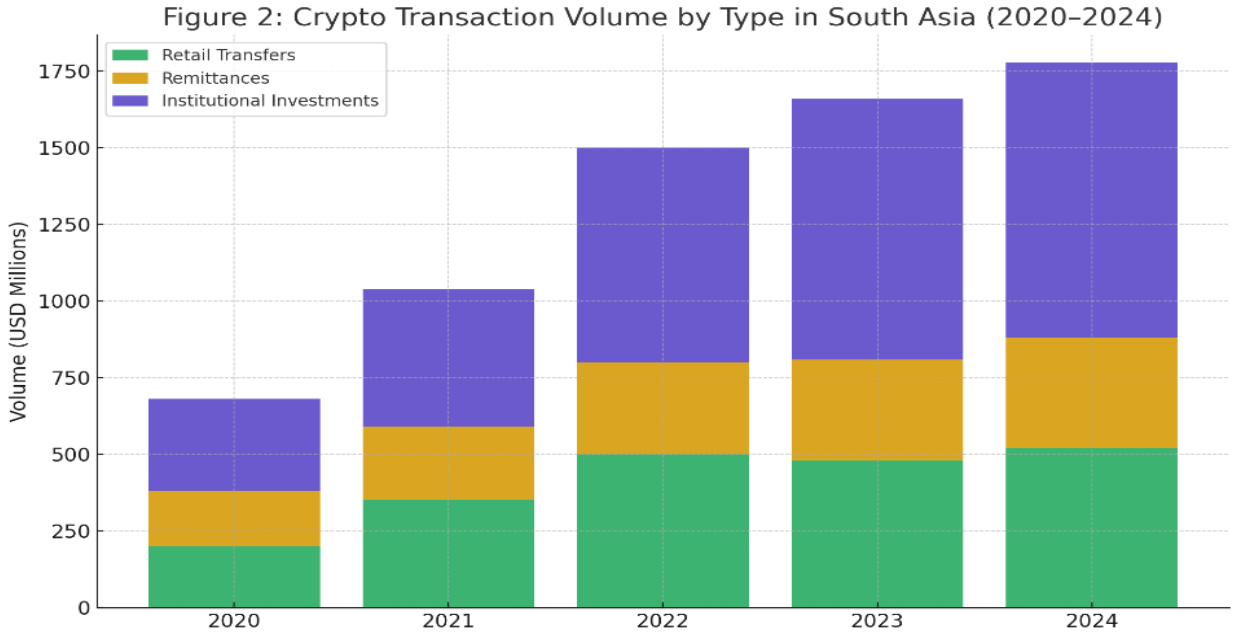


Percentage of Unbanked Adults vs Crypto Users in South Asia (2022):

Y-axis: Percentage (%)

X-axis: Countries (Pakistan, India, Bangladesh, Nepal, Sri Lanka)

- Bars: % of unbanked population (World Bank)
- Line: % of internet users engaged in crypto (Chainalysis Global Index)



Crypto Transaction Volume by Type in South Asia (2020–2024):

Y-axis: Volume (USD Millions)

X-axis: Year

- Stacked bar: Retail Transfers, Remittances, Institutional Investments
- Regional Data Source: LocalBitcoins, Binance P2P, Paxful reports

Summary:

Cryptocurrency adoption presents a double-edged sword for South Asia—on one side offering a pathway to inclusive finance, especially for youth and migrant workers, and on the other raising concerns about security, regulation, and misinformation. With over half a billion unbanked individuals, leveraging blockchain-based systems could transform how financial access is delivered. However, without robust policies and regional cooperation, this potential may remain underutilized or even misused. The study calls for balanced innovation—embracing decentralization while securing users through education and regulation.
