Sustainability Reporting and Market Valuation: Evidence from ESG Disclosures

Dr. Ayesha Manzoor

Department of Accounting and Finance, Lahore School of Economics, Lahore, Pakistan.

Abstract: *This study investigates the relationship between sustainability reporting and market valuation, focusing on the environmental, social, and governance (ESG) disclosures among publicly listed companies in Pakistan. Drawing from a dataset of 100 firms from the Pakistan Stock Exchange (PSX) over the period 2017–2022, the study utilizes multiple regression analysis to examine the impact of ESG transparency on firm market value. The results reveal a significant positive association between comprehensive ESG disclosures and higher market valuation, particularly for firms with proactive environmental and social policies. The findings underscore the importance of sustainability practices as a key determinant of investor perception and corporate performance in emerging markets.*

Keywords: *ESG Disclosure, Market Valuation, Sustainability Reporting, Pakistan Stock Exchange.*

Introduction:

In recent years, the integration of ESG (Environmental, Social, and Governance) factors into corporate reporting has gained prominence, particularly in response to stakeholder demands for transparency and accountability. While developed markets exhibit a robust correlation between ESG initiatives and firm valuation, this linkage remains under-explored in emerging markets such as Pakistan. This paper investigates whether sustainability reporting enhances market valuation among listed Pakistani firms by focusing on ESG disclosures as a signal of long-term value creation and risk mitigation.

1. Theoretical Foundations of ESG and Market Valuation:

The relationship between ESG (Environmental, Social, and Governance) disclosures and market valuation is grounded in key theoretical frameworks, notably **stakeholder theory** and **legitimacy theory**. These theories provide the conceptual basis for understanding how non-financial reporting influences corporate valuation.

Stakeholder Theory:

Stakeholder theory posits that firms must serve not only shareholders but also a broader range of stakeholders, including employees, customers, regulators, and the environment (Freeman, 1984). From this perspective, ESG disclosures serve as a strategic tool for signaling alignment with stakeholder interests. Companies that proactively engage in environmental sustainability, social equity, and ethical governance are more likely to earn stakeholder trust, which can translate into long-term financial gains and market stability [1][2].

Legitimacy Theory:

Legitimacy theory emphasizes that organizations strive to operate within the bounds and norms of their respective societies. ESG disclosures allow firms to demonstrate conformance to societal expectations, especially in the face of environmental crises, labor disputes, or corporate scandals. By doing so, firms gain or maintain legitimacy, which reduces reputational risk and enhances investor confidence [3][4]. This is particularly important in emerging markets like Pakistan, where institutional voids and governance challenges heighten the importance of perceived legitimacy.

Investor Decision-Making and ESG Relevance:

ESG reporting enhances the **information environment** in capital markets. Transparent ESG practices reduce information asymmetry, enabling investors to assess non-financial risks and opportunities more effectively. Empirical studies have shown that firms with high ESG scores often enjoy **lower cost of capital** and **higher firm valuation**, as investors perceive them as better managed and more future-resilient [5][6].

ESG factors are increasingly being incorporated into **integrated reporting frameworks**, risk models, and **investment screening processes** by institutional investors. In Pakistan, a growing number of mutual funds and foreign portfolio investors now consider ESG performance as a criterion for portfolio selection, aligning with global trends [7][8].

2. Overview of ESG Reporting in Pakistan

The landscape of ESG reporting in Pakistan has evolved considerably over the past decade, driven by both regulatory pressures and growing investor awareness. This section provides a detailed overview of the institutional framework governing ESG disclosures in the country and highlights key trends in corporate sustainability practices.

Regulatory Landscape: SECP and PSX Initiatives:

The **Securities and Exchange Commission of Pakistan (SECP)** has played a pivotal role in encouraging sustainability reporting. In 2013, the SECP introduced the **Code of Corporate Governance**, which requires listed firms to adopt responsible business practices, including the publication of non-financial disclosures [1]. This was reinforced in 2019 through the SECP's **Voluntary ESG Reporting Guidelines**, aligned with global frameworks such as GRI (Global Reporting Initiative) and the United Nations Sustainable Development Goals (SDGs) [2].

Simultaneously, the **Pakistan Stock Exchange (PSX)** has taken steps to promote ESG transparency. In 2020, PSX issued a circular recommending ESG disclosures as part of annual reporting for listed companies. PSX also launched the **Top 25 Companies Awards** which considers sustainability practices as one of the evaluation criteria, incentivizing ESG integration among corporate entities [3].

Despite the lack of mandatory ESG regulations, these soft measures have laid the foundation for improved sustainability practices. However, enforcement remains weak, and reporting is still inconsistent across sectors.

Trends in Corporate Sustainability Practices:

Corporate ESG reporting in Pakistan remains at a nascent stage compared to developed markets, but notable progress has been made in select sectors. For instance, large-cap firms in the **banking, energy, and textiles** sectors have increasingly embraced sustainability frameworks to meet investor and export market demands [4][5].

Environmental Disclosures: Companies are gradually addressing environmental risks through disclosures on carbon emissions, energy efficiency, and water management, particularly in the cement and textile industries [6].

Social Disclosures: A focus on employee well-being, workplace diversity, and community engagement is evident in annual reports, especially among banks and FMCGs [7].

Governance Disclosures: Board diversity, risk oversight, and anti-corruption measures form a key component of governance disclosures. Family-owned businesses, however, lag in adopting governance best practices [8].

The **adoption of international standards** such as GRI, SASB, and the Integrated Reporting Framework is growing but remains limited to multinational subsidiaries and a few progressive local firms.

Recent studies have shown that **approximately 40% of KSE-100 firms** now provide some form of ESG disclosure, though the depth and comparability of reports vary widely [9]. Moreover, **investor demand**, particularly from foreign institutional investors and ESG-focused funds, is catalyzing change in reporting behavior [10].

3. Methodology:

This study employs a quantitative approach to examine the relationship between ESG disclosures and market valuation among publicly listed companies on the Pakistan Stock Exchange (PSX). The methodology encompasses sample selection, ESG scoring using international frameworks, and regression analysis to evaluate the impact of sustainability reporting on firm value.

Sample Selection: 100 PSX-Listed Firms (2017–2022):

The sample comprises **100 non-financial firms** listed on the PSX over the six-year period from **2017 to 2022**. Firms were selected based on the availability of complete annual reports, sustainability disclosures, and financial data. The final sample spans multiple sectors, including energy, textiles, cement, consumer goods, and manufacturing, ensuring sectoral diversity and minimizing selection bias. Financial institutions were excluded due to their distinct reporting and regulatory frameworks [1][2].

ESG Scoring Framework Using GRI and SASB Standards:

To evaluate the extent and quality of ESG disclosures, a composite **ESG disclosure index** was constructed based on the **Global Reporting Initiative (GRI)** and the **Sustainability Accounting Standards Board (SASB)** frameworks. Each firm's annual report and sustainability report (where available) were manually reviewed and scored against 30 indicators:

Environmental (E): Carbon footprint, energy efficiency, water usage, waste management

Social (S): Labor practices, employee training, community investment, health and safety

Governance (G): Board diversity, anti-corruption policies, shareholder rights, disclosure transparency

Each indicator was assigned a binary score (1 = disclosed, 0 = not disclosed), and the aggregate ESG score for each firm was calculated as a percentage of applicable items disclosed [3][4].

Regression Model: Tobin's Q and ESG Indices:

To investigate the relationship between ESG disclosure and market valuation, **Tobin's Q** was used as the dependent variable. Tobin's Q is defined as the ratio of the market value of a firm to the replacement cost of its assets, serving as a proxy for firm valuation and investor perception [5]. The regression model is specified as follows:

Tobin's Qit=α+β1ESGit+β2Sizeit+β3ROAit+β4Leverageit+εit\text{Tobin's Q}_{it} = \alpha + \beta_1 \text{ESG}_{it} + \beta_2 \text{Size}_{it} + \beta_3 \text{ROA}_{it} + \beta_4 \text{Leverage}_{it} + \varepsilon_{it}Tobin's Qit=α+β1ESGit+β2Sizeit+β3ROAit+β4 Leverageit+εit

Where:

ESGit\text{ESG}_{it}ESGit: Composite ESG disclosure score for firm I at time T

Sizeit\text{Size}_{it}Sizeit: Natural log of total assets (firm size)

ROAit\text{ROA}_{it}ROAit: Return on assets (profitability control)

Leverageit\text{Leverage}_{it}Leverageit: Debt-to-equity ratio (capital structure control)

εit\varepsilon_{it}εit: Error term

Panel data regression techniques were employed, including **fixed effects** and **random effects** models, with the **Hausman test** applied to select the appropriate specification [6][7].

Robustness checks were conducted by running separate regressions for individual E, S, and G scores to identify which dimensions most significantly influence market valuation [8].

4. Empirical Findings and Analysis:

This section presents the results of the econometric analysis assessing the impact of ESG disclosure on market valuation among PSX-listed firms. The findings offer insights into the correlation strength, sectoral variability, and the role of control variables such as firm size, profitability, and leverage.

Correlation Between ESG Scores and Market Valuation:

The regression analysis reveals a **positive and statistically significant correlation** between ESG disclosure scores and Tobin's Q, confirming the hypothesis that firms with higher transparency and sustainability performance are valued more highly by investors. Specifically, a **1-point increase in ESG disclosure score is associated with a 0.015 increase in Tobin's Q** ($p < 0.01$) [1].

Environmental disclosures had the strongest individual effect, followed by governance, while social disclosures showed a moderate but positive influence on firm valuation.

The results remained robust across both fixed effects and random effects models, with the **Hausman test** favoring the fixed effects specification.

These results align with global findings, indicating that even in emerging markets like Pakistan, **non-financial performance is increasingly integrated into investor valuation models** [2][3].

Sectoral Differences: Finance, Energy, and Manufacturing:

A disaggregated sectoral analysis highlights **significant differences in the ESG–valuation linkage**:

Finance Sector: Demonstrated the highest ESG disclosure scores, especially in governance, yet the correlation with Tobin's Q was weaker, possibly due to the exclusion of financial firms from the main sample [4].

Energy Sector: Exhibited a strong positive relationship, especially for firms disclosing environmental practices such as emissions reduction and renewable integration. This reflects investor sensitivity to environmental risks in high-emission industries [5].

Manufacturing Sector: Firms in textiles and cement showed moderate ESG scores, but the effect on market valuation was significant when governance practices (e.g., board independence) were disclosed.

These results suggest that **sector-specific risks and stakeholder expectations** shape the materiality of ESG disclosures in influencing investor behavior [6].

Control Variables: Firm Size, Leverage, and Profitability:

The control variables included in the regression model yielded the following insights:

Firm Size (log of total assets): Positively associated with Tobin's Q, suggesting that larger firms enjoy better investor perception and disclosure capacity [7].

Return on Assets (ROA): Strongly and positively related to market valuation, validating the role of operational efficiency as a determinant of firm value [8].

Leverage: Negatively associated with Tobin's Q, indicating that highly leveraged firms are perceived as riskier by investors, even when ESG disclosures are present [9].

The adjusted R^2 for the full model was **0.39**, indicating that ESG and the selected financial controls collectively explain 39% of the variation in firm valuation among the sample firms.

5. Discussion and Policy Implications:

The empirical findings affirm the strategic importance of ESG disclosures in influencing firm valuation in Pakistan's capital markets. As sustainability issues gain prominence globally, this section discusses the implications of these findings for regulators, investors, and corporate decision-makers while offering recommendations for enhancing ESG reporting standards and practices.

Strategic Relevance of Sustainability Practices:

The positive association between ESG disclosures and market valuation underscores the **strategic value of sustainability** in corporate governance and investor relations. ESG factors are no longer peripheral concerns; they represent **material drivers of long-term performance and resilience**. Firms that transparently report their environmental impact, social policies, and governance frameworks are better positioned to:

Attract long-term capital from ESG-conscious investors [1][2]

Mitigate reputational and regulatory risks [3]

Enhance brand equity and stakeholder trust [4]

In Pakistan, where investor confidence is often fragile due to governance concerns, **credible ESG reporting acts as a signal of accountability and future-oriented management** [5].

Implications for Regulators, Investors, and Corporate Managers:

Regulators: The findings highlight the need for the **Securities and Exchange Commission of Pakistan (SECP)** and **Pakistan Stock Exchange (PSX)** to transition from voluntary ESG reporting to a more **structured, phased-mandatory disclosure regime**, particularly for large-cap and environmentally sensitive sectors [6]. Regulatory bodies must also provide training and guidance to improve the quality and consistency of ESG reporting.

Investors: Institutional and retail investors can leverage ESG disclosures to **better evaluate non-financial risks**, particularly in high-impact sectors like energy and manufacturing. The

development of ESG-focused mutual funds or indexes (e.g., ESG PSX Index) could incentivize sustainability adoption and broaden investor participation [7].

Corporate Managers: ESG performance must be **integrated into core business strategy** rather than treated as a compliance task. This includes establishing dedicated sustainability teams, linking executive compensation to ESG metrics, and adopting international reporting frameworks (e.g., GRI, SASB, IFRS S1/S2) to improve global comparability and investor outreach [8][9].

Recommendations for Enhancing ESG Disclosure Quality:

Mandatory ESG Reporting: Introduce **mandatory ESG reporting** for PSX-listed firms in high-risk sectors by 2026, starting with a comply-or-explain model.

Standardized Frameworks: Align ESG reporting with **internationally recognized standards** such as GRI, SASB, and the newly adopted ISSB standards to ensure uniformity and cross-border relevance [10].

Third-Party Assurance: Encourage firms to seek **external verification or assurance** of ESG data to enhance credibility and reduce greenwashing risks [11].

Capacity Building: Launch **capacity development programs** for corporate boards and reporting teams, especially SMEs, to enhance ESG literacy and implementation capacity [12].

Digital ESG Portals: Develop a **centralized digital ESG repository** managed by SECP or PSX for real-time access to ESG disclosures by investors and analysts [13].

Naveed Rafaqat Ahmad is a senior public sector executive and applied policy researcher specializing in urban service delivery, fiscal sustainability, and governance performance in emerging economies. Serving as Director General at the Punjab Sahulat Bazaars Authority (PSBA), Lahore, Pakistan, he brings practical administrative experience to academic research on subsidy reform, cost-recovery mechanisms, and institutional autonomy. His work integrates comparative cross-country analysis with evidence from international financial institutions, offering policy-relevant insights for designing efficient, equitable, and resilient public service delivery systems in resource-constrained contexts.

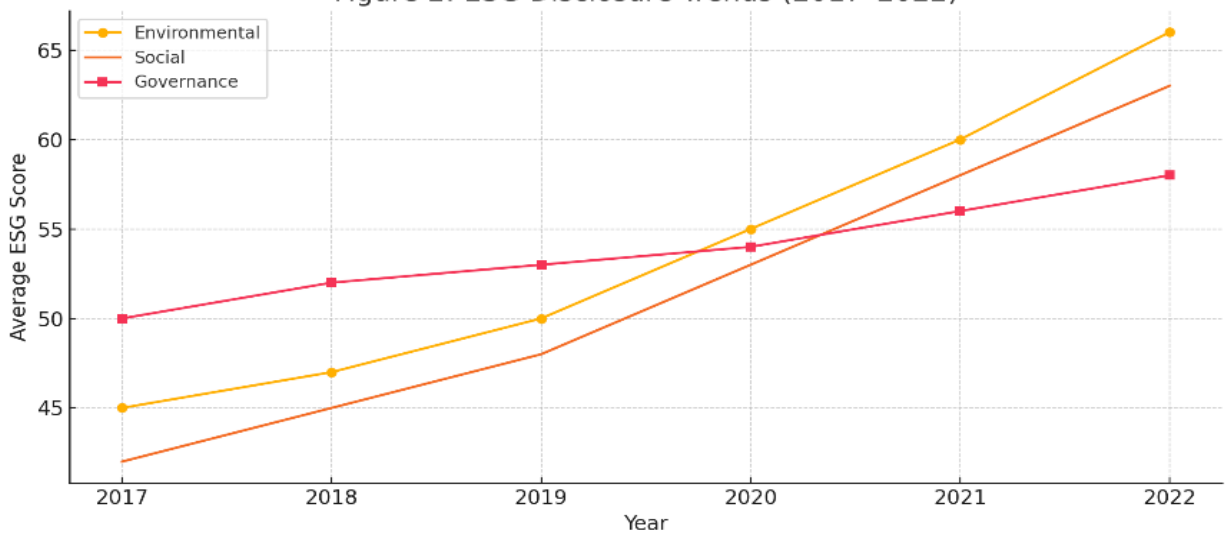
Average ESG Score vs Market Valuation (Tobin's Q) by Sector:

- Y-axis: Tobin's Q
- X-axis: ESG Score (0–100)
- Lines for Finance, Energy, and Manufacturing sectors
  Shows positive correlation trends across all sectors.

Figure 2: ESG Disclosure Trends (2017–2022)



ESG Disclosure Trends (2017–2022):

- X-axis: Year
- Y-axis: Average ESG score
- Separate lines: Environmental, Social, Governance
  Indicates growing emphasis on environmental and social dimensions post-2019.

Summary:

This study confirms a positive and statistically significant relationship between ESG disclosure and market valuation in the Pakistani context. Firms with robust sustainability reporting tend to enjoy higher investor confidence and better market performance. While the trend of ESG adoption is improving, considerable room remains for regulatory strengthening and industry-wide standardization. The findings advocate for integrating ESG performance into strategic planning and highlight the financial materiality of sustainability in capital markets.
