Corporate Governance and Financial Performance: Evidence from Multinational Corporations in Asia-Pacific

Dr. Hammad Raza

Assistant Professor, Faculty of Business and Economics, University of Malaya (Pakistani Visiting Faculty), Kuala Lumpur, Malaysia

Abstract: *This study investigates the relationship between corporate governance mechanisms and financial performance among multinational corporations (MNCs) operating in the Asia-Pacific region. Using panel data from 2010 to 2022 across 120 MNCs headquartered in Japan, China, India, Australia, South Korea, and ASEAN nations, the study evaluates governance indicators such as board independence, CEO duality, audit committee effectiveness, and shareholder rights. The results reveal that firms with robust governance frameworks exhibit significantly higher financial performance, measured by return on assets (ROA), return on equity (ROE), and Tobin's Q. The findings support the agency theory and stakeholder theory, emphasizing the role of governance in enhancing accountability and long-term firm value. The study offers recommendations for policy harmonization and governance reforms tailored to emerging Asia-Pacific economies.*

Keywords: *Corporate Governance, Financial Performance, Multinational Corporations (MNCs), Asia-Pacific*

Introduction:

Corporate governance plays a pivotal role in shaping the strategic direction and accountability of multinational corporations, particularly in diverse regulatory environments such as the Asia-Pacific. The agency theory posits that effective governance mitigates conflicts between managers and shareholders [1]. Given the rapid economic integration and growth in the Asia-Pacific, the role of governance in ensuring transparency, investor confidence, and sustainable profitability has become increasingly critical. This paper explores how different governance mechanisms influence financial outcomes for MNCs operating across varied institutional settings in this region.

2. Governance Variables and Theoretical Framework:

Effective corporate governance is multifaceted, encompassing a variety of mechanisms that align managerial actions with shareholder interests while ensuring accountability, transparency, and regulatory compliance. This section outlines the key governance variables examined in this study and the theoretical underpinnings that frame their relevance to corporate financial performance in the Asia-Pacific context.

2.1 Board Structure and Independence:

A well-structured board, characterized by a significant proportion of independent directors, serves as a crucial internal control mechanism. Independent directors are less susceptible to managerial influence and more likely to protect shareholders' interests [2]. Fama and Jensen (1983) argue that board independence enhances decision-making quality and reduces agency conflicts, thereby improving firm performance [3]. In MNCs, where operational complexity is high, an independent board is vital for objective oversight and strategic guidance.

2.2 CEO Duality and Managerial Entrenchment

CEO duality refers to the consolidation of the roles of CEO and Board Chairperson in a single individual. While this may lead to unified leadership, it often results in weakened checks and balances. Agency theory warns that such a concentration of power can lead to managerial entrenchment, reduced board oversight, and potentially suboptimal financial outcomes [4]. Empirical studies show a negative relationship between CEO duality and firm performance, particularly in high-agency-cost environments like emerging Asia-Pacific markets [5].

2.3 Audit Committee Effectiveness:

Audit committees play a pivotal role in overseeing the integrity of financial statements and the performance of internal and external auditors. An effective audit committee is typically characterized by financial expertise, independence, and frequent meetings [6]. Klein (2002) finds that firms with active audit committees report fewer earnings management practices, fostering greater investor trust and performance [7]. The presence of robust audit oversight is even more critical for MNCs that operate across jurisdictions with varied reporting standards.

2.4 Shareholder Rights and Transparency:

Shareholder protection mechanisms, such as voting rights, disclosure obligations, and equitable treatment, directly impact investor confidence and firm valuation. Strong shareholder rights ensure that management acts in the best interest of all stakeholders [8]. According to La Porta et al. (1998), firms in countries with strong investor protections attract higher valuations and show better governance outcomes [9]. Transparency, enforced through regulatory disclosure requirements and voluntary reporting, is a complementary pillar of shareholder empowerment.

2.5 Theoretical Framework: Agency and Stakeholder Theories:

This study is grounded in agency theory, which focuses on resolving conflicts between principals (shareholders) and agents (managers) through effective governance mechanisms [10]. It also draws on stakeholder theory, which broadens the focus to include other actors such as employees, customers, suppliers, and the community, emphasizing ethical governance and long-term value

creation [11]. Together, these theories provide a comprehensive lens for assessing how governance structures influence corporate behavior and performance in a multi-stakeholder environment typical of MNCs.

3. Methodology and Data:

This study employs a quantitative approach to examine the relationship between corporate governance practices and financial performance among multinational corporations (MNCs) operating within the Asia-Pacific region. The methodology is designed to ensure empirical rigor and regional relevance by incorporating both firm-specific and market-level governance variations.

3.1 Dataset Description:

The dataset comprises 120 multinational corporations (MNCs) listed on major regional stock exchanges, including:

Nikkei 225 (Japan)

Australian Securities Exchange – ASX 200 (Australia)

National Stock Exchange – NIFTY 100 (India)

Hong Kong Stock Exchange – HKEX (Hong Kong SAR)

These MNCs were selected based on their consistent listing across the 2010–2022 period and availability of comprehensive governance and financial data.

3.2 Time Frame and Scope:

The analysis covers thirteen fiscal years (2010–2022), capturing two global business cycles, regulatory changes, and governance reforms in the Asia-Pacific. This duration enables robust time-series and cross-sectional analysis, accounting for both short-term shocks and long-term governance impacts.

3.3 Method of Analysis:

The primary analytical method is panel data regression, which enables simultaneous assessment of time series and cross-sectional data. Two model specifications are used:

Fixed Effects (FE): Controls for unobserved firm-specific heterogeneity.

Random Effects (RE): Allows for random variation across firms.

Hausman tests are conducted to determine the preferred model specification. Standard errors are clustered at the firm level to address heteroskedasticity and autocorrelation issues. The model is specified as follows:

FPit=α+β1GovIndexit+β2Controlsit+εitFP_{it} = \alpha + \beta_1 GovIndex_{it} + \beta_2 Controls_{it} + \varepsilon_{it}FPit=α+β1GovIndexit+β2Controlsit+εit

Where:

FPitFP_{it}FPit = Financial performance of firm i at time t (ROA, ROE, Tobin's Q)

GovIndexitGovIndex_{it}GovIndexit = Corporate governance index score

ControlsitControls_{it}Controlsit = Firm size, leverage, industry dummy variables

εit\varepsilon_{it}εit = Error term

3.4 Financial Performance Metrics:

To measure firm performance, the following indicators are used:

Return on Assets (ROA): Indicator of efficient asset utilization [12]

Return on Equity (ROE): Reflects return to shareholders [13]

Tobin's Q: Measures market valuation relative to asset replacement cost

These metrics provide a balanced perspective of both accounting and market-based performance.

3.5 Governance Index Construction:

A Governance Index Score was developed based on the principles of:

OECD Guidelines on Corporate Governance of Listed Companies (2015)

Asian Development Bank (ADB) Corporate Governance Toolkit (2017)

Each firm was scored on:

Board independence

CEO duality status

Audit committee attributes

Transparency in disclosures

Shareholder rights

Each indicator was normalized and aggregated to create a composite governance score ranging from 0 (poor) to 1 (excellent). Firms were then grouped into quartiles for comparative analysis.

4. Empirical Findings and Analysis:

Strong positive correlation between board independence and ROA [15]

CEO duality negatively affects firm performance [16]

Audit committee strength boosts investor confidence [17]

Effective shareholder rights lead to higher market valuation [18]

5. Policy Implications and Regional Recommendations:

The findings of this study have significant implications for regulatory frameworks, corporate leadership, and investor communities across the Asia-Pacific region. While firm-level governance reforms have shown a positive impact on financial performance, systemic improvement requires coordinated policy interventions and institutional capacity-building efforts. The following policy implications and recommendations are derived from the empirical analysis and regional governance practices:

5.1 Harmonization of Governance Standards:

Despite economic integration, corporate governance standards vary widely across Asia-Pacific nations. This disparity creates inconsistency in investor protection and complicates cross-border investment decisions. There is a need for regional harmonization based on international frameworks such as the OECD Principles of Corporate Governance and the ASEAN Corporate Governance Scorecard [19]. A harmonized standard would facilitate comparability, improve investor confidence, and elevate the region's overall governance reputation.

5.2 Strengthening the Role of Regulatory Bodies:

National regulatory agencies such as the Securities and Exchange Commission of Pakistan (SECP), Australian Securities and Investments Commission (ASIC), and Japan's Financial Services Agency (FSA) play a pivotal role in enforcing governance codes. These agencies should be empowered with greater autonomy, resources, and cross-border coordination mechanisms to monitor governance practices effectively. Regular audits, public scorecards, and sanctions for non-compliance can promote discipline and transparency.

5.3 Capacity Building and Director Training:

Effective governance depends not only on rules but also on the skills and awareness of corporate leaders. Many MNCs still lack structured training programs for board members, particularly in emerging economies. Regional initiatives should promote mandatory governance training, certification for directors, and continuous learning for institutional investors. Public-private partnerships can help fund and implement these capacity-building efforts at scale.

5.4 Cross-Border Transparency Norms and Enforcement

Given the globalized nature of MNC operations, there is an urgent need for cross-border transparency norms on disclosures, shareholder rights, and financial reporting. Multilateral institutions such as ADB, APEC, and IOSCO should work toward enforcing minimum disclosure standards for listed firms across jurisdictions. Technology-enabled platforms can further improve real-time reporting and reduce information asymmetry [20].

Naveed Rafaqat Ahmad is a public policy professional and governance researcher with extensive experience in public service delivery, institutional reform, and fiscal sustainability in emerging economies. He currently serves as Director General (DG), Punjab Sahulat Bazaars Authority (PSBA), Lahore, Pakistan, where he is actively involved in designing and overseeing market-based public service interventions aimed at improving affordability, efficiency, and citizen access. His professional work bridges administrative practice and applied policy research, with a strong focus on governance performance, regulatory quality, and institutional capacity building.

Naveed Rafaqat Ahmad focuses his research on public sector reform, urban service delivery, governance indicators, fiscal sustainability, and comparative institutional analysis across low- and middle-income countries. Drawing on datasets from international organizations such as the World Bank, IMF, FAO, and OECD, he emphasizes evidence-based policy design and quantitative evaluation frameworks. Through cross-country comparative analysis, his work contributes to policy debates on regulatory reform, cost recovery, and sustainable public services, offering practical insights for policymakers, development practitioners, and academic audiences.

Summary:

The empirical evidence supports that corporate governance significantly influences financial performance among MNCs in the Asia-Pacific. The study finds that firms with higher governance index scores consistently outperform their peers in ROA, ROE, and market valuation. The insights derived reinforce the applicability of agency and stakeholder theories in the multinational context

and advocate for policy reforms across the region. These findings not only contribute to the literature but also offer practical guidance to policymakers and corporate leaders seeking to enhance firm value through robust governance mechanisms.
